

Working Prototype Known Problems Report

Product: Remember Me

Team Name: RememberMe

Revision: 06/01/2021

Functions Not Working Correctly

- Adding a contact to favorites page
 - While we have a button to indicate whether a contact is favorited, it wouldn't be able to save to the favorites page.
- Organizing the contacts by creation date
 - When the user logs in for the first time, the contacts are organized by the creation date. However, if a user changes the order from first name to creation date, the contacts aren't ordered by creation date.
- Clicking on the contact to go to their personal information
 - We were able to display contacts' first and last name and phone number on the contact list screen. Due to errors, the contacts' information wouldn't display once the user clicks on the entry to show the contact's personal info.
- Adding more photos to the create new contacts page
 - Was trying to add a button to add more photos for a contact. However, it wouldn't be able to display on the emulator.
- Settings Page in drawer navigation
 - In the settings page, it displays the correct setting adjustments for the applications. When the user clicks, the user wouldn't be taken to a different page since it's not responsive.
- Using tab to go from the email to password in the login screen
 - The user is able to write into the text box for both the email and password. However, if the user presses the tab key, the mouse wouldn't transition from login to password or vice versa.
